Prediction Markets as an Asset Class

Prediction markets are becoming one of the most important financial primitives on the internet.

On the surface, they look simple, markets that let you trade on whether something will happen or not. Elections, wars, policy decisions, sports outcomes, crypto events, price predictions, cultural moments, etc. But underneath that simplicity is something much bigger.

Prediction markets are markets on reality itself. They let capital express beliefs about the future, and compress dispersed information, incentives, and conviction into a single price. When they function properly, that price is often more accurate than polls, pundits, analysts, or headlines.

That makes prediction markets not just another niche product, but a legitimate asset class in its own right.

The asset class with the largest potential TAM

Every major asset class is constrained by *what it can trade*.

Stock markets trade companies, crypto trades networks, protocols, and narratives, commodities trade physical goods, and rates trade money over time.

Prediction markets trade *outcomes*.

Anything with uncertainty and a future resolution is tradable - that universe is effectively unbounded.

As more of the world moves online, more events become measurable, verifiable, and settleable. That dramatically expands what can turned into a market. From a pure surface-area perspective, prediction markets may end up with the **largest total addressable market of any asset class**.

Not because they replace others, but because they sit *above* them, expressing beliefs about all of them and more.

Maturation brings professionals

Over the past few months, prediction markets crossed an inflection point.

Volumes increased, liquidity improved, market breadth expanded. More importantly, the participant base changed.

Serious traders, quants, researches, and funds started paying attention. Not because prediction markets are trendy, but because they're information-dense, and highly inefficient in interesting ways.

Prediction markets have crossed the stage of early experimention and proven the demand for this asset class. The retail and demand already exists, but the liquidity doesn't. This is the clear point of professionalization and infrastructure catch-up.

An asset class without a terminal

In every mature market, professionals trade through terminals.

The stock markets have Bloomberg, perps have Hyperliquid, memecoins have Axiom and Padre.

Memecoins, one of the most chaotic corners of finance, still ended up with some of the highest quality tooling once real money arrived.

But in prediction markets today, most participants are still trading off raw market pages with:

- Minimal context
- No good discovery
- No understanding of who's trading
- No way to track good wallets
- No coherent view of flow across markets
- Poor execution
- Poor charting

Serious capital obviously can't operate with this. Once an asset class attracts professionals, trading with minimal or fragmented information becomes

unacceptable. The absence of a proper terminal isn't just inconvenient, it's a structural limitation on the entire category.

Why tooling defines winners

As prediction markets mature, the performance gap between participants will widen.

Not because some people are smarter, but because some people are better equipped.

Better tooling means:

- Faster feedback loops
- More complete information
- Clearer visibility into flow and conviction
- Better execution and risk management
- Superior market and wallet discovery

In markets where information *is* the edge, trading without context is negative EV.

This is **exactly** what we saw with memecoins. Once Axiom emerged, they didn't just make trading easier, **they changed who won**.

You were playing a losing game if you weren't using a terminal like Axiom.

Prediction markets are at that same moment.

Fireplace Pro

Fireplace Pro exists because prediction markets deserve to be treated like a real asset class, not a novelty or a gambling platform.

A place where serious participants can discover opportunities across markets, understand who's trading and how, track flow, liquidity, and conviction, analyze probabilities as they evolve, and confidently execute with speed.

All in one environment.

Fireplace Pro is built to be the terminal for prediction markets. Nothing competes.

The inevitable outcome

If prediction markets continue on their current trajectory, better infrastructure isn't optional, it's inevitable.

Asset classes don't mature without tooling. Professionals don't participate without terminals.

Fireplace Pro is our answer to what this category actually needs.

Prediction markets are becoming a real asset class, and real asset classes deserve real terminals.
